

Bzetnoz.

1610.

A new Almanacke and
Prognostication for the
yeare of our Lord.

God. 1610

Being the second from the Bissextile
or leape yeare.

Calculated and composed according
to Art, for the latitude and meridian
of the Honorable Citie of London,
and may very well serue all
the south parts of great
Brittain.

By Thomas Bretnor, teacher of A-
rithmetique, and Geometrie, in
the most famous Citie
of London.

Printed at London for the Compa-
ny of Stationers.

**A note of the mooue-
able feasts according
to our accompt.**

Bretnor. 1610.

A Prognostication
for this present yeare of
our Lord GOD.

M-DC. X.

Being the Second from the Bisextile,
or Leape-yeare.

Wherein (besides the generall state of the
four Quarters of the yeare, and the
weekly disposition thereof) are briefly
set downe sundry Physicall notes,
and other directions of good
consequence.

Together with the Eclipes of the Moone,
and other planitarie bodyes, as they
will appeare this present
yeare. 1610.

Physically argued from the severall habitudes
and effectes of this our earthly Globe, to
that of Light, and others; and of
all of them one to an other.

By

Thomas Bretnor, Student
in Physicke.

Imprinted at London for the
Companie of Stationers.

1610.

To the Reader.

That I haue something swarued from the opinion of most The-
nographes, in accompting the number of yeares since the
worlds adoption, let it not seeme strange vnto thee (courteous
Reader) for that as there is but few of them which agree among
themselves: so, mee thinkes, the groundes of their accomptes
proceed not frst to solid a radix, as that of the learned & industrious Scot
M. Robert Pont, founded vpon Sabaticall yeares: to whose Treatise
(Of the last decaying age of the World) for further satisfaction in this
and other popnts, I wholly referre thee. Neither am I of their opinion,
which contend about the beginning of our blisall yeare, for the better date-
ing of Euidences. &c. The which as I take to be idle, so I thinke there
is none so simple a Scribe in this Kingdome, which vnderstandeth not
the date of any Euidence without helpe of the words Compleat and Cur-
rent: for that we (nothing regarding the Astronomicall or other feasti-
nall popnt) doe alwayes begin our Computation the 25. of March, still
reckoning the yeare current, and neuer compleat as they dreame. And fur-
ther concerning the precession of the Equinoxe, I thinke it not greatly
materiall to insist vpon, although some do much busie their bzaines about
it: for though it be confessed indeed, that the same Starre which whilome
was in the very interfection of the Vernall popnt, be now remooued from
the same eastward 28. degrees 10. minutes, and so consequently each se-
uerall Constellation sheweth the roomth of another: yet if it be graun-
ted that neither the fixed Starres nor Planets themselves, doe act or
giue any influx at all but by reflection, & that from the Sunne, for other
there is none: And that the Planets be tearmed Ferales and Vacui, bin-
lesse that either by configuration or corporall congreffe they beholde one
another: And also that when they returne to the same degree of the Hea-
uens, wherein they were at the radix of a Natinitie, or at any other stated
time (although they find not the same fixed Starre there precisely neither
in longitude nor latitude) doe vndoubtedly effect the thinges presignified
by them (salued miraculous infringement in as ample manner, as if such a
fixed Starre were partitely ioyned with them: And that the Planets
which do nearer approach our Zenith, receiue stronger influx then when they
be more remote, as also that in each severall Signe there be fixed Starres
of like temperature & magnitudo, I know no reason but that the Moore,
or any other Planet coming to the Vernall interfection, or any other
popnt of the Zodiacke, should giue like influenciall rayes as in auuncient
time: for though it be graunted by Ptolomie himselfe, and approoued by
modern Astronomers, that the Dodecatemories haue something altered
their pristine temperature, and that with Mirandula some vanitie in the
aplicities be conuersed, as also by our selves acknowledged, that V. & T.
were

● To the Reader.

were neuer so hot and dry, nor δ and η so cold and dry, nor ζ and π so cold and moist, nor α and ω so hot and moist, as is described of them but rather that γ may be termed hot and moist, and ω cold & moist, then other wise, and so of the rest: yet notwithstanding that there is a secret mysterie in these Triplicities, as also in the deuision of the 12. Celestiall Houses, and termies of the Planets, no good Astrologer will deny. If any man aske me the reason hereof, I would demand of him likewise, Whence cometh the sympathie and antipathie betwixt all vegetable Minerall and Animall creatures: Why doth man naturally feare the Serpent, the Lion the Cocke the Cocke the Kite, the Mouse the Catte, the Hare the Hound? Whence springeth enmitie betwixt the Dogge and the Wolfe, the Horse and the Brare, the Hart and the Rammie, the Vine and the Bay tree, the Serpent and the Ash-tree, the Burre and the Lentill, the Diamond and the Load-stone? Whence accrew the variable tinctures and vermilion coulours of Leaues, Flowers, and Fruites: the exquisite smelling of the Spaniell, the presaging iudgement of sundry Beastes, Fowles, and Fishes: the carefull prouidence of the Ant, the orderly government of the Bee: and aboue all, the strange effectes (for so we may terme them) of septenarie, nonenarie, and denarie Numbers, with their commensurable partes, so well obscured in Philosophie, and experimented in the Climactericall peares of mans life, and ages of the world? Whence come these, say I, but from such secrets in Nature, whercunto the capacitie of man can hardly reach. Hence wee may gather, that (in Physicall directions) neither the Signe wherein the Moone is, nor Planet with whom she is ioyned or configured, nor termies of the infortunes, or via lactea, are to be neglected: which might be altogether, if the nature of the Signes were quite altered, as some pretend. I intended here also to haue spoken something concerning the Reformation of our English Calender, which since the birth of our blessed Sauour, hath anticipated the iust time 14. dayes: so that if the world should continue 17. thousand peares longer, Midsummer day would be on the shortest day in the peare: By continuance of which uncorrected accompt, what errour groweth aswell in the celebration of the soleinne Feast of Easter, as in all other moueable & stated Feastes is more then euidently apparant: For saluing whereof, the sayd B. Pope hath likewise deuised an easie Reformation by neglecting the Leape-peare for 56. peares together, as by his sayd Treatise may appeare: But as this errour, and many moe, may be lamented, yet not amended but by authoritie from the Prince and State, I leaue them wholly to their prudent consideration, and rest my selfe ever thy heartie well wisher.

Thomas Bretnor.

Certaine Phisicall Directions : And first of Phlebotomie.

Let Blood at no time, except
upon urgent occasion, and
then not without great con-
sideration of these 3. things : viz.

1. The time of the yeare.
2. The complexion and age of the Patient.
3. The place and configuration of the Moone.

I. For the time of the yeare : The Spring and Autumne, are most hollosome, as freest from nipping cold, or parching heate, with this proviso, that Blood be taken in the Spring time, from the right side : and in Autumne, from the left.

For the Complexion : Generally let blood, the Moone in Aries, first halfe of Libra, and Aquarius.

But more particularly let Blood,

The	{	Flegmaticke,	{	the Moone in	{	Aries, or Sagittari.
		Chollericke,				Cancer, or Pisces.
		Melancholick				Aquari, Libra first halfe.
		Sanguine,				any of them.

And for yeares, let blood

The	{	younger,	{	from the	{	Change to the first quarter.
		aged,				First quarter to the full.
		more aged,				Full to the last quarter.
		decrepit,				Last quarter to the change.

The most laudable Aspectes for this purpose, are the Coniunction of the Moone with Iupiter or Venus : and her Trine or Sextile with them and with the Sunne and Mercury.

The Moones Trine and Sextile with Mars : as also her Quartile and Opposition with Iupiter and Venus are indifferent.

But in any case let not the Moone at such time, be neare the Coniunction, Quartile, or Opposition of the Sunne, Saturne, or Mars : or any of them in like configuration with other.

Make Scarification in like Signs and Aspectes as in Phlebotomie : saving that this is effected with better successe, the Moone increasing.

A Prognostication.

For Purging.

AS in Phlebotomie, so likewise in Purging, great care ought to be taken of the time of the yeare, strength and constitution of the Patient, Place, and Configuration of the Moone, &c.

And surely as purgative medicines taken at any time, without great need, are very dangerous: so violent Purgations can never be administered without great prejudice to the bodie's state, for that their venomous and virulent qualitie can not be so clearely euacuated, but that there is left to me degrees of their corrodive nature.

The seasons prescribed in Phlebotomie, are also good for this purpose: and Summer is not amisse, if the Canicular dayes prove not too vntemperately hot: for such is the state thereof (for the most part) with us, that it little differeth from their Spring in Spaine, or 2 month part of France: and seeing that our Countrey men are more given to surfeit then they, and that, Plus necat gula quam censis, I wish them either to avoid that common sinne, or by Physicall meanes seeke to prevent future Maladies.

And that the Medicine may worke with better successe, Purge euery in the wane of the Moone, with this consideration also: that

Flegme be purged with	{	Electuaries,	{	the Moone in	{	Cancer.
		Potions,				Scorpio.
		Pilles,				Pisces.

And in a Trine or Sextile of Mars, or the Sunne.

Choller be purged with	{	Electuaries	{	the Moone in	{	Cancer.
		Potions,				Scorpio.
		Pilles,				Pisces.

And in a Trine or Sextile aspect of Venus.

Melancholy be purged with the same Medicines, the Moone sciteth as before, and in a Trine or Sextile of Iupiter.

The best time	{	Attractive	{	is best	{	V, R, F.	
		Retentive				h,	holpen 2
		Digestive				u,	Moone
		Expassive				d & f,	in

Prepare Humours the Moone in Gemini, Libra, or Aquarius.

Use Purgings the Moone in Cancer, Leo, Virgo.

Take	{	Coniues,	{	the Moone in	{	Aries, Taur. Leo, or Capri.
		Gargarismes				Cancer, or Aries.
		Clutras,				Aries, Libra, or Scorpio.

A Prognostication.

Bathfor { Hot diseases, the Moone in Cancer, Scorpio. or Pisces,
and in a Trine or Sextile of Iupiter or Venus.
Cold diseases, the Moone in Aries, Leo, or Sagittari, and
in a Trine or Sextile of Mars or Sol.
Cleanlines, the Moone in Libra or Pisces, & in a Trine
or Sextile of Venus.

Certaine Rurall and Nauricall Aduertisements.

Set or sow } moyst } ground, the Moone } decreasing.
seedes in } dry } } increasing.
She being then placed vnder Aries, Cancer, Virgo, Libra, Capricor.
or Pisces, and in a Trine or Sextile aspect of Saturne, together with
Iupiter or Venus.
Grasse or Plant, the Moone in Taurus or Aquarius, and in like con-
figuration.
Cutte or presse Hayes at the full of the Moone, and when she is in
Taurus, Leo, Scorpio. or Sagittarie.
Sette or remooue Plants, Rootes, and such like, from the change to
the full.
Seld or Libbe Cattle from the last quarter to the change, the Moone
placed in Aries, Sagittarie, or Capricorne.
Sheare or clippe Sheepe, the Moone increasing.
Fell Timber for building, from S. Martins day untill mid-January,
and in the last quarter of the Moone.
Plash Hedges, and Loppe Trees for Fewell, the Moone increasing
in Aries or Libra, and aspected of Iupiter or Venus.
Cut haire the better to grow, the Moone in Taurus, Virgo, or
Libra, and in a Trine or Sextile of Iupiter or Venus increasing.
To destroy haire, Comes, Waines, Wartes, or such like excrescen-
ces. Cut them in the Last quarter, and when she is in a Coniuncti-
on, Quartile, or Opposition of Iupiter or Mars.
Weane or take Children from nurse towards the full, when she is
weyde of course and is not seated in Taurus, or Libra.
Hunt Wild beastes the Moone in Aries, Leo, or Sagittary, and in a
good aspect of Iupiter or Mars, and the ascendent moueable.
Hauke for Fowle the Moone in Gemini, Virgo, Sagittary, or Pisces,
and in a good aspect of Iupiter, Venus, or Mercury.

Set

Set Sayle the Moone increasing, and when she is swift in count, and separated from a Trine or Sextile of the Sunne, Iupiter, Venus, or Mercury; not Retrograde or Combust, and applyeth vnto any of them with like illumination.

Likewise the Ascendent, a watery Signe, and the Lord thereof, in the 3. or 9. house fortunate, or in a good Aspect with the Lord of either of them, or either of the Fortunes, or Mercury in the 1. 3. or 9. house, well affected, denote a prosperous & speedy voyage.

But in any case let not the Moone or Lord of the Ascendent be conioyned with the stormy constellations of Orion, Arcturus, Canis Maior or Minor, the Hædi, or Hircus; or toynd or configured with any Retrograde, or unfortunate Planet, or the Moone or any infortune in the 1. 7. or 4. house, or Mars or Saturne angular.

A perfect and easie way to finde the time of high Water, in most places of this Kingdome, and Countries adioyning.

[If the Calender is set downe the houre and minute of Full sea at London-bridge, for every day in the month, according to the Moones motion; which may be hindered or furthered by Cloudes or Land-floods, as the one is stated, or the other falleth: But as these are seldom extreame, so they do not often cause any great difference in time. If therfore you desire to know the time of Full-sea in any place here noted, looke for the day of the moneth, & against the same rightwardes (ioyning to the Foraine Account) you shall finde the houre & min. of Full-sea at London-bridge, & for any other place: adde or substract so many houres & minuts to or from the time there set downe, as this little Table following shall appoynt, and the whole of the one, or remainder of the other, shalbe the time required. Example.

The 13. of Februarie I would know the time of Full-sea at London-bridge: Against that day in the Colonne under the title, I finde that it is high-water there at 3. a clocke. Now desiring to know what time it shall be Full-sea the same day at Linne, Humber, Weymouth, &c. I adde 3. houres (as this Table following sheweth) and it maketh 6. a clocke, the time of Full-sea in all those places. And for Gravesend, Downes, Tenet. &c. substracting an houre & an halfe, I finde Full-sea there, halfe an houre past one; and so of all the rest.

A Prognostication,

A Prognostication. Of the Eclipses happening this yeare. 1610.

And first, of the Moone.

Through this yeare, will the Masse-earth eclipse and hide part of Titan his glorious beames from the view of the Selenian-inhabitants, and thereby deprive her selfe of the Moones wonted re-
flexion of Sunshyne. The first Eclipsation whereof will appeare the xxvi. of June at iii. a clocke and 56. minutes in the morning; at which instant, the Moone will be at her greatest obscuration, having above three quarters of her body darkened by the Earthes diametrical position: she will begin to hide her selfe 11. minutes after 2. and continue untill 2. quarters after 5. before she be perfectly illumined; so that the whole continuance of this Eclipse, will be three houres and a halfe. We in England shall see but the noitie thereof, for that she will set at the moment of her greatest obscuration; but the Virginians and Americans shall see and feelee the full force thereof.

The effects begin to worke the first of July 1611. and end the 16. of October following: whereof I spare to speake, untill the next yeares revolution.

The second Eclipse of the Moone will happen the 19. of December at two a clocke and 56. minutes after midnight; at which time she will be at her greatest opacitie, having halfe her body shadowed from the Sunnes comfortable rayes, by the interposition of our Grand-daime Dys, betwixt her and the same. She shall begin to be darkened halfe an houre after one a clocke, and continue untill 4. and 12. min. before she recover her totall light: so that the whole continuance of this Eclipse, will be two houres 32. minutes.

The effectes begin to worke in force the 10. of October 1611. and end the 25. of December following: untill which yeare, I suspend the iudiciall part thereof.

Of the Eclipse of the Sunne.

Through also this yeare will that generall informer (the Sunne) be eclipsed from the sight of our Antipodes, whereof the first (happening the 10. of June) will be most notable for the inhabitants of Iama-minor and about the Straights of Magellanes, will see the same at high noone (when they expect him in his greatest height and splendor) totally darkened, and (as it were) deprived of naturall light.

This Eclipse happening to them in the 9. & 10. Celestiall houses,
and

and in the last Decade of Gemini, both foretold the death of some great Prince or Potentate amongst them: with great losse and hurt to their publicke estate, making frustrate as well their Civil as Ecclesiasticall designments.

The second of the Sunns will onely be scene of the Turkes and Hander: within the Medieterrane-Sea the 5. of December in the morning: whose effects are like to appeare in the destruction of those Warlike Voyes, and all successe in Militarie intendment.

Of other Eclipses happening this yeare 1610.

TO giue a glimpse of the grosse opacitie of the Starres and Planets, together with their peculiar influences who soever listeth to behold that glorious light the Sunne the 3. of May in the morning, or rather (according to Euerart) at 3. a clocke and 37. minuts in the after noone, may see the goodly Planet Venus appeare like a blacke spot in his Northerne moitie. eclipsing onely so small a portion thereof, by reason of her great distance from vs, her shadow ending in a Cone, as soone as it toucheth the Earths superficies: which no doubt upon the body of the Moone, maketh as great an Eclipse as the Moone doth to vs when she is more then halfe darkened.

Touching the effects, Venus (gouvernesse of the Coniunction) having principall dignity in the Ascendent, and dispositor of the Sunne, placed in the 8. House and quartilely behelde of Saturne (Natures enemy) may very well signifie to sundry, losse of inheritance, with trouble and veracion about Women; and that many through their lewd and inordinate carage, will be cause of their owne deaths.

The wittie Planet Mercury will likewise be a spot in the Sunnes body the 27. of May in the morning; or rather (according to Euerart) the 26. day in the after noone: which Coniunction falling in the 7. House & aspectes to a square of Mars, & an opposition of the Moone: doth not onely presignifie blustering and stormy Windes, but also stirreth up contentious humors amongst Schollers & Mercantiles; a generall losse to them selves, and scandalous to the common people.

Fierie Mars will likewise eclipse frostie Saturne the 22. of April at night, as Maginus sayth; or the 21. at noone, as Euerart affirmeth: which happening neare the cuspe of the 7. and in opposition of the Moone, doth not onely preface some extraordinary quantitie of haille and moisture, but also strange & lingering distresses amongst the common people.

Of

Of the generall disposition of the 4. Quarters
of the yeare : And first of Winter.

Winter (after usuall account) did begin the 11. of December last, at 3. a clocke and 50. minutes in the after noone: at which instant, the Sunne entered the first min. of the solstitiall signe Capricorne, although indeed it doth more naturally begin about the 28. of October, when the Sunne toucheth the 15. degree of Scorpio, for then commeth a sensible change of Autumnall heate & drynesse, into a Winter-like kind of coldnesse & moysture: so that in trueneth, that poynt which we usually call the beginning of Winter, is rather the vera Center and deapth thereof. And so by like reason, may the Spring be sayd to begin when the Sunne commeth to the 15. degree of Aquarius, and Sommer at the like degree of Taurus, & Autumne at the 15. of Leo: for that according to this deuision, the beginning & end of each Quarter, hath great remission, and the middle more intention of heate or drynesse, coldnesse or moysture (according to the qualitie of the season) then after vulgar account: which how it sorteth natures order, I leaue to the iudgment of the learned Philosopher.

In this Quarter (besides his naturall weatherage of colones and moysture) w. ll many tempestuous Winds, and blustering stormes of snow and sleet be stirring, tedious aswell to the warlike Winter, as marfacing Countreiman. Many and strange Diseases will creepe abroad: much theft, rapine, and robberye wilbe committed this Quarter: losse and detriment by lewd wemen and fugitiue seruants.

Of the Spring.

The Spring usually taketh his beginning at such a period of time, as the Sunne hath apparantly made his returne from the Winters Solstice, unto the first scruple of the Equinoctiall signe Aries: which by the most exact obseruations of that thyke noble and learned Dane Ticho Brahe falleth out this yeare the 10. of March at 3. a clocke 21. minutes, and 52. seconds in the after noone: which disageeth from the calculation of honest Euerarc anticipating the same 10. howeers 40. min. & 41. seconds. This Annuall season, as it is not likely to be free from the rage of violent Winds, with stormy gustes & flauers: so will there be many sun-shine dayes, and much sonner like weather in the same. Diseases likewise wilbe very frequent, and Feuers of all sorts much abounding: great danger to women with child, and much sicknesse amongst aged people and young children is portended.

In this Revolution also wilbe much transmigration and packing beyond

beyond Seas, great rumours of Warres, but end in nothing: much uncharitable dealing amongst men, many Persecutions in the age, & an Earthquake is threatned.

Of Sommer.

Sommer is sayd to take his beginning at such an instant as the fountaine of heat and light hath attained unto the farthest poynt of his Northerne declination; or the earth rather by his continuall revolution made his greatest Southerne inclination: which (either way taken) cometh to passe the 11. of June at 10. a clocke 20. min. and 14. seconds in the afternoone. for then is the Sunne newly approached the first point of the Crabs constellation, making longest dayes and shortest nights, to this Northerne World.

This Quarter beginning the very day of the Change, the 7. of Aquarius ascending, and Saturne therein retrograde, Mars also within the same angle, and in the traine of his enemy: all the rest of the Planets together with the Dragons-head, placed in the 6. House, and in the watry-signe Cancer, rising, culminating and setting with starres of violent and tempestuous nature: All at they may signifie besides lightning, thunder, inundations, and perillous Diseases, I leave to the consideration of my Masters in this Art: onely thus much, that the Heavens seeme to deplore the deceitfull, ambitious, and licentious kind of living of most men in these our dayes, and that there is almost neither trust nor true friendship left in the world.

Of Harvest.

A Vintage, other wise called Harvest, commonly taken for the fourth part of the Astronomica'll yeare, maketh his first entry (after old opinion) at such time as that glorious Lampe of light hath againe made apparance of declination from the Tropical signe Cancer unto the first point of the Equinoctiall signe Libra. which happeneth this yeare the 13. of September at 4. a clocke 42. min. and 8. seconds in the afternoone, causing againe equal dayes and nights to the whole vniuers. This Quarter, after his naturall qualitie, is like to prove very cold and dry, with some intermixture of frosts and hoary blasts: neither will diseases (commonly haunting this season) be wanting, for besides the annuall recourse of Cramps, Convulsions, Botches, Stitches, Strangury, Collicke, and Rheumes, will vnicusomed Fevers, and sundry distempers of doubtful cure, appeare.

**A more particular prædiction as well of the rising
and setting of the Planets, and Ayres dayly disposition,
as of the Good and Euill dayes in euery Month, for the
better election of fit seasons to take any
waighty matter in hand.**

*Notimus autem ijs qui diligunt deum omnia simul conferre ad
bonum, iis inquam qui ex proposito ipsius vocati sunt. Rom. 8. 28.*

Januarie.

Frowning Saturne is our Evening Starre.

Friendly Iupiter is Southeast at Sunne setting.

Marslike Mars ryseth two howers before the Sunne.

Wanton Venus and wylie Mercury are both Morning starres.

The i. ii. and iii. dayes, freezing. The iiii. and v. dayes more open.

**Last Quarter the vi. day, at 1. a clocke and 11. min. at night (the 1. of
the ascending,) and the vii. viii. & ix. dayes, kindly winters weather.**

The x. xi. and xii. dayes, some snow fall.

**New Moone the xiii. day, two min. before midnight (the 25. of the
ascending) and the xv. and xvi. dayes, frostie. The xvii. xviii. and
xix. dayes, open and clondy.**

**First Quarter the xxii. day, at iiii. a clocke and 49. min. in the mor-
ning (the 24. of the ascending) and the xxiii. xxiiii. and xxv. dayes, in-
crease of windes with snow or sleete. The xxvi. and xxvii. dayes,
not much differing.**

**Full Moone the xxviii. day 1. min. after midnight (the 7. of the ascen-
ding) and the xxix. freezing cold dayes.**

Good dayes.

1. A good beginning.
4. A Courtiers promise.
5. It smels well.
9. Cappe and curtelle.
12. Heart and good will.
17. S'ache and sure.
18. Weather for a penny.
19. 20. Kind greeting.
22. 23. Cup and comer too.
24. Strike while tis hot.
30. A Saint is shew.

Euill dayes.

2. But a branado.
3. Wille the Cushion.
6. Mad-medling.
7. Subtill sophistrie.
8. Bee at no cost.
10. Deale not with him.
11. 13. 16. As good sit still.
14. 15. Gall in the end.
21. As unkind as may be.
25. 26. Backe againes better.
28. 29. A blow with a hyeume bill.
31. A reuenging heart.

Febru-

Februarie.

Saturne and Mercury whisper close before the Sunne.

Iupiter is in the Meridian at Sun-setting.

Mars is South-east at Sun-rising.

Venus is our chearefull Day-starre.

The i. ii. iii. and iiii. dayes windy and waivering.

Last quarter the v. day, at vi. a clocke 48. min. in the evening (the 17. of ny. ascending) and the vi. and vii. dayes, disposed to moisture.

The viii. ix. & x. losse Winds. The xi. & xii. more wet then wished.

Beu Moone the xiii. day, at two a clocke and 47. min. in the after noone (the 10. of \mathcal{N} ascending) and the xiiii. xv. and xvi. dayes inclined to snow. The xvii. and xviii. dayes, no great change.

First Quarter the xx. day 25. min. before noone (the 9. of \mathcal{S} ascending) and the xxi. day, kindly weather. The xxi. xxii. and xxiii. dayes, some blustering stormes.
